RETROVIRAL PROTEASE INHIBITORS

This application is a continuation-in-part of U. S. Patent Application Serial No. 07/615,210, filed November 19, 1990.

BACKGROUND OF THE INVENTION

1. Field of the Invention

5

The present invention relates to retroviral protease inhibitors and, more particularly, relates to novel compounds and a composition and method for inhibiting retroviral proteases. This invention, in particular, relates to urea-containing hydroxyethylamine protease inhibitor compounds, a composition and method for inhibiting retroviral proteases such as human immunodeficiency virus (HIV) protease and for treating a retroviral infection, e.g., an HIV infection. The subject invention also relates to processes for making such compounds as well as to intermediates useful in such processes.

2. Related Art

During the replication cycle of retroviruses, 20 gag and gag-pol gene products are translated as proteins. These proteins are subsequently processed by a virally encoded protease (or proteinase) to yield viral enzymes and structural proteins of the virus core. 25 Most commonly, the gag precursor proteins are processed into the core proteins and the pol precursor proteins are processed into the viral enzymes, e.g., reverse transcriptase and retroviral protease. It has been shown that correct processing of the precursor proteins 30 by the retroviral protease is necessary for assembly of infectious virons. For example, it has been shown that frameshift mutations in the protease region of the pol gene of HIV prevents processing of the gag precursor It has also been shown through site-directed 35 mutagenesis of an aspartic acid residue in the HIV protease that processing of the gag precursor protein is prevented. Thus, attempts have been made to inhibit

viral replication by inhibiting the action of retroviral proteases.

Retroviral protease inhibition typically involves a transition-state mimetic whereby the

5 retroviral protease is exposed to a mimetic compound which binds (typically in a reversible manner) to the enzyme in competition with the gag and gag-pol proteins to thereby inhibit replication of structural proteins and, more importantly, the retroviral protease itself.

10 In this manner, retroviral replication proteases can be

Several classes of mimetic compounds have been proposed, particularly for inhibition of proteases, such as for inhibition of HIV protease. Such mimetics

include hydroxyethylamine isosteres and reduced amide isosteres. See, for example, EP 0 346 847; EP 0 342,541; Roberts et al, "Rational Design of Peptide-Based Proteinase Inhibitors, "Science, 248, 358 (1990); and Erickson et al, "Design Activity, and 2.8Å.

effectively inhibited.

HIV protease inhibitors.

20 Crystal Structure of a C₂ Symmetric Inhibitor Complexed to HIV-1 Protease," <u>Science</u>, 249, 527 (1990).

Several classes of mimetic compounds are known to be useful as inhibitors of the proteolytic enzyme renin. See, for example, U.S. No. 4,599,198; U.K.

25 2,184,730; G.B. 2,209,752; EP O 264 795; G.B. 2,200,115 and U.S. SIR H725. Of these, G.B. 2,200,115, GB 2,209,752, EP O 264,795, U.S. SIR H725 and U.S. 4,599,198 disclose urea-containing hydroxyethylamine renin inhibitors. However, it is known that, although renin and HIV proteases are both classified as aspartyl proteases, compounds which are effective renin inhibitors generally cannot be predicted to be effective

BRIEF DESCRIPTION OF THE INVENTION

The present invention is directed to virus inhibiting compounds and compositions. More particularly, the present invention is directed to retroviral protease inhibiting compounds and compositions, to a method of inhibiting retroviral proteases, to processes for preparing the compounds and to intermediates useful in such processes. The subject compounds are characterized as urea-containing hydroxyethylamine inhibitor compounds.

25

30

35 wherein P represents an amino protecting group, and R² is as defined above, is reduced to the corresponding alcohol utilizing an appropriate reducing agent. Suitable amino protecting groups are well known in the art and include carbobenzoxy, butyryl, t-butoxycarbonyl, acetyl, benzoyl and the like. A preferred amino protecting group is carbobenzoxy. A preferred N-

protected chloroketone is N-benzyloxycarbonyl-Lph nylalanine chloromethyl ketone. A preferred reducing

5 preferably at about 0°C, in a suitable solvent system
such as, for example, tetrahydrofuran, and the like.
The N-protected chloroketones are commercially available
from Bachem, Inc., Torrance, California. Alternatively,
the chloroketones can be prepared by the procedure set

10 forth in S. J. Fittkau, J. Prakt. Chem., 315, 1037
(1973), and subsequently N-protected utilizing
procedures which are well known in the art.

The resulting alcohol is then reacted, preferably at room temperature, with a suitable base in a suitable solvent system to produce an N-protected amino epoxide of the formula:

20

25

40

In addition, the isocyanates and isothiocyanates are commercially available from Aldrich Chemical Company.

wherein t, P, R¹, R¹, R¹, R², R³, R⁴, R⁵ and Y are as defined above. Preferred protecting groups in this

instance are a benzyloxycarbonyl group or a tbutoxycarbonyl group. Where the amine is reacted with a
derivative of an amino acid, e.g., when t=1 and R¹ and
R¹ are both H, so that the amino acid is a β-amino acid,
such β-amino acids can be prepared according to the
procedure set forth in a copending application, U. S.
Serial No. 07/345,808. Where t is 1, one of R¹ and R¹ is H and R¹ is hydrogen so that the amino acid is a homoβ-amino acid, such homo-β-amino acids can be prepared by
the same procedure. Where t is O and R¹ is alkyl,
cycloalkyl, -CH₂SO₂NH₂ or an amino acid side chain, such
materials are well known and many are commercially
available from Sigma-Aldrich.

The N-protecting group can be subsequently removed, if desired, utilizing the procedures described above, and then reacted with a carboxylate represented by the formula:

20

25

wherein R is as defined above and L is an appropriate leaving group such as a halide. Preferably, where R¹ is a side chain of a naturally occurring α-amino acid, R is a 2-quinoline carbonyl group derived from N-hydroxysuccinimide-2-quinoline carboxylate, i.e., L is hydroxy succinimide. A solution of the free amine (or amine acetate salt) and about 1.0 equivalent of the carboxylate are mixed in an appropriate solvent system and optionally treated with up to five equivalents of a base such as, for example, N-methylmorpholine, at about room temperature. Appropriate solvent systems include tetrahydrofuran, methylene chloride or N,N-dimethylformamide, and the like, including mixtures thereof.

Preparation of Compounds of Formula III

A mercaptan of the formula R'SH is reacted with a substituted methacrylate of the formula:

5

10

by way of a Michael Addition. The Michael Addition is

conducted in a suitable solvent and in the presence of a
suitable base, to produce the corresponding thiol
derivative represented by the formula:

20

25

wherein R' and R¹ represent radicals defined above; R²0 and R²¹ represent hydrogen and radicals as defined for R¹; and R²² represents radicals as defined by R³. Suitable solvents in which the Michael Addition can be conducted include alcohols such as, for example, methanol, ethanol, butanol and the like, as well as ethers, e.g., THF, and acetonitrile, DMF, DMSO, and the like, including mixtures thereof. Suitable bases include Group I metal alkoxides such as, for example sodium methoxide, sodium ethoxide, sodium butoxide and the like as well as Group I metal hydrides, such as sodium hydride, including mixtures thereof.

40

The thiol derivative is converted into the corresponding sulfone of the formula:

by oxidizing the thiol derivative with a suitable oxidation agent in a suitable solvent. Suitable oxidation agents include, for example, hydrogen peroxide, sodium meta-perborate, oxone (potassium peroxy monosulfate), meta-chloroperoxybenzoic acid, and the like, including mixtures thereof. Suitable solvents include acetic acid (for sodium meta-perborate) and, for other peracids, ethers such as THF and dioxane, and acetonitrile, DMF and the like, including mixtures

The sulfone is then converted to the corresponding free acid of the formula:

thereof.

utilizing a suitable base, e.g., lithium hydroxide, sodium hydroxide, and the like, including mixtures

thereof, in a suitable solvent, such as, for example, THF, acetonitrile, DMF, DMSO, methylene chloride and the like, including mixtures thereof.

The free acid is then coupled, utilizing, as described above, procedures well known in the art, to the urea derivative, or analog thereof, of an amino alcohol which is described above for the preparation of compounds of Formula II. The resulting product is a compound represented by Formula III.

Alternatively, one can couple the urea isostere to the commercially available acid,

5

10

remove the thioacetyl group with a suitable base, such as hydroxide, or an amine, such as ammonia, and then

15 react the resulting thiol with an alkylating agent, such as an alkyl halide, tosylate or mesylate to afford compounds at the following structure:

20

25

The sulfur can then be oxidized to the corresponding sulfone using suitable oxidizing agents, as described above, to afford the desired compounds of the following structure:

35

40

45 Alternatively, to prepare compounds of Formula III, a substituted methacrylate of the formula:

wherein L represents a leaving group as previously defined, R^{35} and R^{36} represent hydrogen and radicals as defined for R1; and R37 represents alkyl, aralkyl, cycloalkyl and cycloalkylalkyl radicals, is reacted with a suitable sulfonating agent, such as, 15 for example, a sulfinic acid represented by the formula R'SO₂M, wherein R' represents radicals as defined above

and M represents a metal adapted to form a salt of the acid, e.g., sodium, to produce the corresponding sulfone represented by the formula:

30

25

20

wherein R', R35, R36 and R37 are as defined above. The sulfone is then hydrolyzed in the presence of a suitable 35 base, such as lithium hydroxide, sodium hydroxide and the like, to the compound represented by the formula:

45 wherein R', R35 and R36 represent radicals as defined The resulting compound is then asymmetrically hydrogenated utilizing an asymmetric hydrogenation

catalyst such as, for example, a ruthenium-BINAP complex, to produce the reduced product, substantially enriched in the more active isomer, represented by the formula:

5

10

wherein R', R³⁵ and R³⁶ represent radicals as defined above. Where the more active isomer has the R-stereochemistry, a Ru(R-BINAP) asymmetric hydrogenation catalyst can be utilized. Conversely, where the more active isomer has the S-sterochemistry, a Ru(S-BINAP) catalyst can be utilized. Where both isomers are active, or where it is desired to have a mixture of the two diastereomers, a hydrogenation catalyst such as platinum, or palladium, on carbon can be utilized to reduce the above compound. The reduced compound is then coupled to the urea isostere, as described above, to produce compounds of Formula III.

Preparation of Compounds of Formula IV

To produce compounds of Formula IV, starting with a lactate of the formula:

. 30

35

40 wherein P" represents alkyl radicals, such as, for example, ethyl, methyl, benzyl and the like. The hydroxyl group of the lactate is protected as its ketal by reaction in a suitable solvent system with methyl

isopropenyl ether (1,2-methoxypropene) in the presence of a suitable acid. Suitable solvent systems include methylene chloride, tetrahydrofuran and the like as well as mixtures thereof. Suitable acids include POCl₃ and the like. It should be noted that well-known groups other than methyl isopropenyl ether can be utilized to form the ketal. The ketal is then reduced with diisobutylaluminum hydride (DIBAL) at -78°C to produce the corresponding aldehyde which is then treated with ethylidene triphenylphosphorane (Wittig reaction) to produce a compound represented by the formula:

15

20

一年 一年 一年 一年 一年

25

The ketal protecting group is then removed utilizing procedures well-known in the art such as by mild acid hydrolysis. The resulting compound is then esterified with isobutyryl chloride to produce a compound of the formula:

35

40

45

This compound is then treated with lithium:

diisopropyl amide at -78°C followed by warming of the

reaction mixture to room temperature to effect a Claisen

rearrangement ([3,3]) to produce the corresponding acid represented by the formula:

5

15

10

Treatment of the acid with benzyl bromide in the presence of a tertiary amine base, e.g., DBU, produces the corresponding ester which is then cleaved oxidatively to give a trisubstituted succinic acid:

25

20

30

The trisubstituted succinic acid is then coupled to the urea isostere as described above. To produce the free acid, the benzyl ester is removed by hydrogenolysis to produce the corresponding acid. The acid can then be converted to the primary amide by methods well-known in the art.

An alternative method for preparing trisubstituted succinic acids involves reacting an ester 40 of acetoacetic acid represented by the formula:

10 where R is a suitable protecting group, such as methyl, ethyl, benzyl or t-butyl with sodium hydride and a hydrocarbyl halide (R31X or R32X) in a suitable solvent, e.g., THF, to produce the corresponding disubstituted 15 derivative represented by the formula:

25

This disubstituted acetoacetic acid derivative is then treated with lithium diisopropyl amide at about -10°C and in the presence of PhN(triflate), to produce a vinyl triflate of the formula:

30

40

35

The vinyl triflate is then carbonylated utilizing a palladium catalyst, e.g., Pd,(OAc),(Ph,)P, in the presence of an alcohol (R"OH) or water (R"=H) and a base, e.g., triethylamine, in a suitable solvent such as DMF, to produce the olefinic ester or acid of the formula: 45

The olefin can then be subsequently asymmetrically hydrogenated, as described above, to produce a trisubstituted succinic acid derivative of the formula:

25 If R" is not H, R" can be removed by either hydrolysis, acidolysis, or hydrogenolysis, to afford the corresponding acid, which is then coupled to the urea isostere as described above and then, optionally, the R group removed to produce the corresponding acid, and optionally, converted to the amide.

Alternatively, one can react the urea isostere with either a suitably monoprotected succinic acid or glutaric acid of the following structure;

40
$$\begin{array}{c} 0 \\ 0 \\ \text{CH}_2 \end{array})_{\text{t}} \begin{array}{c} 0 \\ \text{R}^3 \end{array} \begin{array}{c} 0 \\ \text{$$

45

followed by removal of the protecting group and conversion of the resulting acid to an amide. One can also react an anhydride of the following structure;

5

10

15 with the urea isostere and then separate any isomers or convert the resulting acid to an amide and then separate any isomers.

It is contemplated that for preparing compounds of the Formulas having R6, the compounds can be 20 prepared following the procedure set forth above and, prior to coupling the urea derivative or analog thereof to the amino acid PNH(CH2), CH(R1)COOH, carried through a procedure referred to in the art as reductive amination. Thus, a sodium cyanoborohydride and an appropriate 25 aldehyde R⁶C(0)H or ketone R⁶C(0)R⁶ can be reacted with the urea derivative compound or appropriate analog at room temperature in order to reductively aminate any of the compounds of Formulas I-IV. It is also contemplated that where R3 of the amino alcohol intermediate is 30 hydrogen, the inhibitor compounds can be prepared through reductive amination of the final product of the reaction between the amino alcohol and the amine or at any other stage of the synthesis for preparing the inhibitor compounds.

35

Contemplated equivalents of the general formulas set forth above for the antiviral compounds and derivatives as well as the intermediates are compounds otherwise corresponding thereto and having the same general properties wherein one or more of the various R 40 groups are simple variations of the substituents as d fined therein, e.g., wherein R is a higher alkyl group than that indicated. In addition, where a substituent

WO 92/08701 PCT/US91/08613

is designated as, or can be, a hydrogen, the exact chemical nature of a substituent which is other than hydrogen at that position, e.g., a hydrocarbyl radical or a halogen, hydroxy, amino and the like functional 5 group, is not critical so long as it does not adversely affect the overall activity and/or synthesis procedure.

EXAMPLE 9

Additional exemplary compounds of the present invention are listed in Table 1. These compounds were prepared according to the following general procedures.

General Procedure for the Synthesis of 1.3-Diamino 4-phenyl Butan-2-ol Derivatives.

A mixture of the amine R³NH₂ (20 equiv.) in dry isopropyl alcohol (20mL/mmol of epoxide to be converted) was heated to reflux and then treated with an N-Cbz amino epoxide of the formula:

25

from a solids addition funnel over a 10-15 minute period. After the addition is complete the solution was maintained at reflux for an additional 15 minutes and the progress of the reaction monitored by TLC. The reaction mixture was then concentrated in vacuo to give an oil that was treated with n-hexane with rapid stirring whereupon the ring opened material precipitated from solution. Precipitation was generally complete within 1 hr and the product was then isolated by filtration on a Büchner funnel and then air dried. The product was further dried in vacuo. This method affords amino alcohols of sufficient purity for most purposes. General procedure for the Reaction of Amino Alcohols

15 with Isocyanates: Preparation of Ureas

A solution from the amino alcohol in tetrahydrofuran (THF) was treated at room temperature with the appropriate isocyanate of formula R'NCO via syringe under nitrogen. After the reaction has stirred for ~5m the progress of the reaction was monitored by TLC. The solvent was removed in vacuo and the product obtained was of sufficient purity for most purposes. The product may be further purified by dissolution in ethyl acetate and washing with 5% aqueous citric acid, water, and brine. The solvent is dried over anhydrous magnesium sulfate, filtered and concentrated in vacuo to give the pure urea.

General Procedure for the Removal of the Protecting

General Procedure for the Removal of the Protecting
Groups by Hydrogenolysis with Palladium on Carbon

30 A. Alcohol Solvent

The Cbz-protected peptide derivative was dissolved in methanol (ca.20mL/mmol) and 10% palladium on carbon catalyst is added under a nitrogen atmosphere. The reaction vessel is sealed and flushed 5 times with nitrogen and then 5 times with hydrogen. The pressure is maintained at 50 psig for 1-16 hours and then the hydrogen replaced with nitrogen and the solution filtered through a pad of celite to remove the catalyst.

The solvent is removed in vacuo to give the free amino derivative of suitable purity to be taken directly on to the next step.

B. Acetic Acid Solvent

The Cbz-protected peptide derivative was dissolved in glacial acetic acid (20mL/mmol) and 10% palladium on carbon catalyst is added under a nitrogen atmosphere. The reaction vessel is flushed 5 times with nitrogen and 5 times with hydrogen and then maintained 10 at 40 psig for about 2h. The hydrogen was then replaced with nitrogen and the reaction mixture filtered through a pad of celite to remove the catalyst. The filtrate was concentrated and the resulting product taken up in anhydrous ether and evaporated to dryness 3 times. 15 final product, the acetate salt, was dried in vacuo and is of suitable purity for subsequent conversion. General Procedure for Removal of Boc-protecting Group with 4N Hydrochloric Acid in Dioxane

The Boc-protected amino acid or peptide is 20 treated with a solution of 4N HCl in dioxane with stirring at room temperature. Generally the deprotection reaction is complete within 15 minutes, the progress of the reaction is monitored by thin layer chromatography (TLC). Upon completion, the excess 25 dioxane and HCl are removed by evaporation in vacuo. The last traces of dioxane and HCl are best removed by evaporation again from anhydrous ether or acetone. hydrochloride salt thus obtained is thoroughly dried in vacuo and is suitable for further reaction.

30 EDC/HOBt Coupling of Cbz-Asparagine (General Procedure) \underline{N} -CBZ-(L-asparagine (1.10eq) and \underline{N} hydroxybenzotriazole (HOBt) (1.5eq) are dissolved in dry dimethylformamide (DMF) (2-5mL/mmol) and cooled in an ice bath. 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide 35 hydrochloride (EDC) (1.10eq) is added to the stirring solution and maintained at 0°C for 10 minutes. solution of the amino component (free amine), 1.0eq in DMF (1-2mL/mmol), is added. [In the case of the amine

hydrochloride or acetate salt, an equivalent of Nmethylmorpholine is also added.] The reaction mixture
is stirred at 0°C for 1 hour and then at room
temperature for ~5-6 hours. The reaction mixture is
then poured into a rapidly stirring solution of 60%
saturated aqueous sodium bicarbonate (ca-50mL/mmol). An
immediate white precipitate forms which is collected on
a Büchner funnel and the solid washed thoroughly with
saturated aqueous sodium bicarbonate, water, 5% aqueous
citric acid solution and water. The product is
thoroughly dried in vacuo and redissolved in DMF,
filtered and reprecipitated by the addition to water.
The precipitated product is isolated by filtration,
washed again with water and dried in vacuo.

15 General Procedure for Acylation with 2-Quinoline
Carboxylic Acid N-Hydroxysuccinimide Ester

A solution of the free amine (or amine acetate salt) and 1.0 equivalent of N-hydroxysuccinimide 2-quinoline carboxylate in anhydrous dichloromethane was treated with 1.5 equivalents of N-methylmorpholine (NMM) at room temperature. The progress of the reaction was monitored by TLC and when the reaction was complete the reaction mixture was diluted with additional dichloromethane and the solution washed with saturated aqueous sodium bicarbonate, 5% aqueous citric acid, water and brine. The solution was dried over anhydrous magnesium sulfate, filtered and concentrated in vacuo. The product thus obtained was recrystallized from a mixture of acetone and hexane.

Example 15

The compounds shown in Table 7 were prepared according to the following general procedure.

This general procedure represents a Curtius

Rearrangement and reaction with the amino alcohol derivative as prepared following the general procedure in Example 9.

To a solution of 1 mmol of carboxylic acid in 12 mL of toluene and 3 mmol of triethylamine at 90°C under a nitrogen atmosphere, was added 1 mmol of diphenylphosphoryl azide. After 1 hour, a solution of 1 mmol of amino alcohol derivative in 3.5 mL of either N,N-dimethylformamide or toluene was added. After 1 hour, the solvent was removed under reduced pressure,

thyl acetate and water added and the layers separated.

The organic layer was washed with 5% citric acid, sodium bicarbonate, brine, dried, filtered and concentrated to afford the crude product. This was then recrystallized or chromatographed on silica gel to afford the purified final compound.

)		Example 47 The effectiveness of the compo	ounds listed in	

The effectiveness of the compounds listed in Table 9 were determined in the above-described enzyme assay and in a CEM cell assay.

The HIV inhibition assay method of acutely 25 infected cells is an automated tetrazolium based colorimetric assay essentially that reported by Pauwles et al, J. Virol. Methods 20, 309-321 (1988). Assays were performed in 96-well tissue culture plates. 30 cells, a CD4 cell line, were grown in RPMI-1640 medium (Gibco) supplemented with a 10% fetal calf serum and were then treated with polybrene (2 μ g/ml). An 80 μ l volume of medium containing 1 x 104 cells was dispensed into each well of the tissue culture plate. 35 well was added a 100μ l volume of test compound dissolved in tissue culture medium (or medium without test compound as a control) to achieve the desired final concentration and the cells were incubated at 37°C for 1 hour. A frozen culture of HIV-1 was diluted in culture 40 medium to a concentration of 5 x 10^4 TCID₅₀ per ml (TCID₅₀ = the dose of virus that infects 50% of cells in tissue culture), and a 20 µL volum of the virus sampl (c ntaining 1000 $TCID_{50}$ of virus) was added to wells containing test compound and to wells containing only 45 medium (infected control cells). Several wells received WO 92/08701 PCT/US91/08613

-124-

culture medium without virus (uninfected control cells).

Likewise, the intrinsic toxicity of the test compound was determined by adding medium without virus to several wells containing test compound. In summary, the tissue culture plates contained the following experiments:

1. + - 10 2. + + 3. + -			Cells	Drug	Virus
1. + - 10 2. + +		-			
10 2. + +		1.		-	-
3. + -)	2.	+	+	· -
	•	3.	+		+
4. + +		4.	+	+	+

In experiments 2 and 4 the final

concentrations of test compounds were 1, 10, 100 and 500 μg/ml. Either azidothymidine (AZT) or dideoxyinosine (ddI) was included as a positive drug control. Test compounds were dissolved in DMSO and diluted into tissue culture medium so that the final DMSO concentration did not exceed 1.5% in any case. DMSO was added to all control wells at an appropriate concentration.

Following the addition of virus, cells were incubated at 37°C in a humidified, 5% CO, atmosphere for 7 days. Test compounds could be added on days 0, 2 and 25 5 if desired. On day 7, post-infection, the cells in each well were resuspended and a 100μ l sample of each cell suspension was removed for assay. A 20 µL volume of a 5 mg/ml solution of 3-(4,5-dimethylthiazol-2-yl)-2,5diphenyltetrazolium bromide (MTT) was added to each 30 100μ L cell suspension, and the cells were incubated for 4 hours at 27°C in a 5% CO, environment. During this incubation, MTT is metabolically reduced by living cells resulting in the production in the cell of a colored formazan product. To each sample was added $100\mu l$ of 10%35 sodium dodecylsulfate in 0.01 N HCl to lyse the cells, and samples were incubated overnight. The absorbance at 590 nm was determined for each sample using a Molecular Devices micr plat reader. Absorbance values for each

set of wells is compared to assess viral control inf ction, uninfected control cell response as well as test compound by cytotoxicity and antiviral efficacy.

Total daily dose administered to a host in single or divided doses may be in amounts, for example, from 0.001 to 10 mg/kg body weight daily and more usually 0.01 to 1 mg. Dosage unit compositions may contain such amounts of submultiples thereof to make up the daily d se.

The am unt of active ingredient that may b combined with the carrier mat rials to produce a single

dosag form will vary depending upon the host treated and the particular mode of administration.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination, and the severity of the particular disease undergoing therapy.

The compounds of the present invention may be administered orally, parenterally, by inhalation spray, rectally, or topically in dosage unit formulations containing conventional nontoxic pharmaceutically acceptable carriers, adjuvants, and vehicles as desired. Topical administration may also involve the use of transdermal administration such as transdermal patches or iontophoresis devices. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection, or infusion techniques.

Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable 30 vehicles and solvents that may be employed are water, Ringer's solution, and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be 35 empl yed including synthetic mono- or diglycerides. addition, fatty acids such as oleic acid find use in the preparation f injectabl s.

25

Suppositories for rectal administration of the drug can be prepar d by mixing the drug with a suitable nonirritating excipient such as cocoa butter and polyethylene glycols which are solid at ordinary 5 temperatures but liquid at the rectal temperature and will therefore melt in the rectum and release the drug.

Solid dosage forms for oral administration may include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound may be 10 admixed with at least one inert diluent such as sucrose lactose or starch. Such dosage forms may also comprise, as in normal practice, additional substances other than inert diluents, e.g., lubricating agents such as magnesium stearate. In the case of capsules, tablets, 15 and pills, the dosage forms may also comprise buffering agents. Tablets and pills can additionally be prepared with enteric coatings.

Liquid dosage forms for oral administration may include pharmaceutically acceptable emulsions, 20 solutions, suspensions, syrups, and elixirs containing inert diluents commonly used in the art, such as water. Such compositions may also comprise adjuvants, such as wetting agents, emulsifying and suspending agents, and sweetening, flavoring, and perfuming agents.

While the compounds of the invention can be administered as the sole active pharmaceutical agent, they can also be used in combination with one or more immunomodulators, antiviral agents or other antiinfective agents. When administered as a 30 combination, the therapeutic agents can be formulated as separate compositions which are given at the same time or different times, or the therapeutic agents can be given as a single composition.

The foregoing is merely illustrative of the invention and is not intend d to limit the invention to 35 the disclosed compounds. Variations and changes which are obvious to one skilled in the art are int nd d to be within th scop and nature of the invention which are defined in the appended claims.

The preceding examples can be repeated with similar success by substituting the generically or specifically described reactants and/or operating conditions of this invention for those used in the preceding examples.

From the foregoing description, one skilled in the art can easily ascertain the essential characteristics of this invention, and without departing from the spirit and scope thereof, can make various changes and modifications of the invention to adapt it to various usages and conditions.

FURTHER INFORMATION CONTINUED FROM THE SECOND SHEET							
V. X OBSERVATION WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE 1 Partially							
This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:							
1. X Claim numbers 68-77, 118-122, 165-169 because they relate to subject matter not required to be searched by this							
"Remark: Although claims 68-77,118-122,165-169 are directed to a method of							
of treatment of the human/animal body, the search has been carried out and							
based on the alleged effects of the compounds.							
2. X Claim numbers 1-169 Incompletely because they relate to parts of the International application that do not comply with the prescribed requirements to such an extent that no meaningful International search can be carried out, specifically:							
Ine use of terms such as neteroary! and heterocyclyl are in contradiction to the line is a co							
the requirements of Art. 6 PCT. The search was performed on the basis of those claims which are clear and concise and of those examples in the description							
which are complete and correct.

3. Claim numbers the second and third sentences of PCT Rule 6.4(a).							
BSERVATIONS WHERE UNITY OF INVENTION IS LACKING 2							
This International Searching Authority found multiple Inventions in this International application as follows:							
As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application

3. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:							
4. As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not							
Invite payment of any additional fee. Remark on Protest							
The additional search fees were accompanied by applicant's protest.							
No protest accompanied the payment of additional search fees.
